ADDITIONAL ROLE-SPECIFIC ARTIFACT

Make senior attention allocatable.

A Director managing 2-4 brands cannot let the loudest Slack message determine the week. This small simulator is a candidate hypothesis for discussing how senior attention might be allocated across client consequence, cash exposure, decision latency, and team load.

Not a claim about Bravo's internal prioritization method. The weights and sample clients are illustrative only and should be replaced by SOW commitments, client context, and Bravo's existing management system.

Client A · Retail launch

Service risk	**80**
Cash exposure	**55**
Decision latency	**75**
Team load	**60**

68

Weighted attention score

Suggested weekly attention: 5.3 hrs

Client B · Inventory reset

Service risk	**50**
Cash exposure	**90**
Decision latency	**50**
Team load	**45**

61

Weighted attention score

Suggested weekly attention: 4.7 hrs

Client C · Co-man recovery

Service risk	**92**
Cash exposure	**70**
Decision latency	**85**
Team load	**75**

81

Weighted attention score

Suggested weekly attention: 6.3 hrs

Client D · ERP cleanup

Service risk	**35**
Cash exposure	**40**
Decision latency	**60**
Team load	**80**

48

Weighted attention score

Suggested weekly attention: 3.7 hrs

Illustrative priority: Client C → Client A → Client B → Client D. Reassess with SOW deadlines, irreversible decisions, relationship risk, and work only the Director can own.

HOW TO USE IT IN AN INTERVIEW

Discuss the missing dimensions.

The point of the artifact is not the formula. The useful conversation is what the formula omits: SOW deadlines, client relationship risk, irreversible decisions, junior-team capability, category seasonality, fundraising/board moments, retailer launches, and what only the Director can do.

Why this matters: Bravo's model asks Directors to manage client relationships, operational outcomes, junior team members, and client hours across several brands. A visible attention-allocation mechanism can make tradeoffs explicit before overload becomes invisible.
